Summary of Mobile Application Security Test

This application was tested once during the last 12 months.

|	
App version	4.7.2
App ID	com.tradono.android
Device type	android
Test started	May 5th, 2023 12:24:21 GMT+0
Test finished	May 5th, 2023 12:41:46 GMT+0
Test runtime	17 minutes
APK source	User upload

Mobile Application Permissions and Privacy Test

Privacy Policy

| Privacy Policy was not found in application | Misconfiguration or weakness |

Mobile Application Permissions

The mobile application requests the following permissions that may endanger user's privacy under certain circumstances:

| ACCESS_COARSE_LOCATION | dangerous |

Access coarse location sources, such as the mobile network database, to determine an approximate phone location, where available. Malicious applications can use this to determine approximately where you are.

| ACCESS_FINE_LOCATION | dangerous |

Access fine location sources, such as the Global Positioning System on the phone, where available. Malicious applications can use this to determine where you are and may consume additional battery power.

| CAMERA | dangerous |

Allows application to take pictures and videos with the camera. This allows the application to collect images that the camera is seeing at any time.

| WRITE_EXTERNAL_STORAGE | dangerous |

Allows an application to write to external storage.

| ACCESS_NETWORK_STATE | normal |

Allows an application to view the status of all networks.

| ACCESS_WIFI_STATE | normal |

Allows an application to view the information about the status of Wi-Fi.

FLASHLIGHT	normal

Allows the application to control the flashlight.

FOREGROUND_SERVICE	normal

Allows a regular application to use Service.startForeground.

INTERNET	normal

Allows an application to create network sockets.

RECEIVE_BOOT_COMPLETED	normal

Allows an application to start itself as soon as the system has finished booting. This can make it take longer to start the phone and allow the application to slow down the overall phone by always running.

VIBRATE	normal

Allows the application to control the vibrator.

WAKE_LOCK	normal

Allows an application to prevent the phone from going to sleep.

Other Permissions

POST_NOTIFICATIONS	unknown

Other permission

OWASP Mobile Top 10 Security Test

The automated audit revealed the following security flaws and weaknesses that may impact the application:

0 CRITICAL RISK	**2** HIGH RISK	**4** MEDIUM RISK	**5** LOW RISK	**9** WARNING

CLEARTEXT SQLITE DATABASE [DAST] [M2] [CWE-312]   HIGH

Description:

The mobile application uses an unencrypted SQLite database.
This database can be accessed by an attacker with physical access to the mobile device or a malicious application with root access to the device.
The application should not store sensitive information in clear text.

HARDCODED ENCRYPTION KEYS [SAST] [M5] [CWE-798]   HIGH

Description:

Hardcoded encryption keys can jeopardize secure data storage and transmission within the mobile application by allowing an attacker to decrypt any potentially sensitive information.

Example of secure code:

```
// Don't hardcode encryption keys in your code.
             // You can generate a key with KeyGenerator,
             // use an user input, or retrieve it from a server via secure
protocol.
             KeyGenerator keyGen = KeyGenerator.getInstance("AES");
             keyGen.init(key_size);
             SecretKey secretKey = keyGen.generateKey();
```

Example of insecure code:

```
byte[] key = {1, 2, 3, 4, 5, 6, 7, 8};
             SecretKeySpec spec = new SecretKeySpec(key, "AES");
             Cipher aes = Cipher.getInstance("AES");
             aes.init(Cipher.ENCRYPT_MODE, spec);
             return aesCipher.doFinal(secretData);
```

There is **'SecretKeySpec()'** found in file 'com/leanplum/internal/AESCrypt.java':

```
[line 206:            byte[] bytes2 = Constants.Crypt.IV.getBytes("UTF-8");]
[line 207:            SecretKeySpec secretKeySpec = new
SecretKeySpec(SecretKeyFactory.getInstance("PBEWithMD5And128BitAES-CBC-
OpenSSL").generateSecret(new PBEKeySpec(str.toCharArray(), bytes, 1000,
256)).getEncoded(), "AES");]
[line 208:            Cipher instance =
Cipher.getInstance("AES/CBC/PKCS5Padding");]
```

CVSSv3 Base Score:

7.4 (AV:N/AC:H/PR:N/UI:N/S:U/C:H/I:H/A:N)

EXPOSURE OF POTENTIALLY SENSITIVE DATA [DAST] [M2] [CWE-200]

MEDIUM

Description:

The mobile application may expose potentially sensitive information during its runtimes.

- POTENTIAL URL FOUND 05-05 14:26:43.242 W/com.facebook.UserSettingsManager(4944): Please set a value for AutoLogAppEventsEnabled. Set the flag to TRUE if you want to collect app install, app launch and in-app purchase events automatically. To request user consent before collecting data, set the flag value to FALSE, then change to TRUE once user consent is received. Learn more:

https://developers.facebook.com/docs/app-events/getting-started-app-events-android#disable-auto-events.

- POTENTIAL URL FOUND 05-05 14:26:43.242 W/com.facebook.UserSettingsManager(4944): You haven't set a value for AdvertiserIDCollectionEnabled. Set the flag to TRUE if you want to collect Advertiser ID for better advertising and analytics results. To request user consent before collecting data, set the flag value to FALSE, then change to TRUE once user consent is received. Learn more: https://developers.facebook.com/docs/app-events/getting-started-app-events-android#disable-auto-events.

- POTENTIAL URL FOUND 05-05 14:26:43.392 W/com.facebook.internal.NativeProtocol(4944): Apps that target Android API 30+ (Android 11+) cannot call Facebook native apps unless the package visibility needs are declared. Please follow https://developers.facebook.com/docs/android/troubleshooting/#faq_267321845055988 to make the declaration.

CVSSv3 Base Score:

5.5 (AV:L/AC:L/PR:L/UI:N/S:U/C:H/I:N/A:N)

WEAK HASHING ALGORITHMS [SAST] [M5] [CWE-916]

MEDIUM

Description:

The mobile application uses weak hashing algorithms. Weak hashing algorithms (e.g. MD2, MD4, MD5 or SHA-1) can be vulnerable to collisions and other security weaknesses, and should not be used when reliable hashing of data is required.

Example of secure code:

```
MessageDigest md = MessageDigest.getInstance("SHA-256");
```

Example of insecure code:

```
MessageDigest md = MessageDigest.getInstance("SHA-1");
```

There is **'getInstance("MD5")'** found in file 'com/leanplum/internal/Util.java':

```
[line 63:     private static String md5(String str) throws Exception {]
[line 64:         MessageDigest instance = MessageDigest.getInstance("MD5");]
[line 65:         instance.update(str.getBytes(Charset.forName("UTF-8")));]
```

There is **'getInstance("MD5")'** found in file 'com/leanplum/internal/FileManager.java':

```
[line 118:          try {]
[line 119:              MessageDigest instance =
```

```
MessageDigest.getInstance("MD5");]
[line 120:            try {]
```

There is **'getInstance("MD5")'** found in file 'com/danikula/videocache/ProxyCacheUtils.java':

```
[line 69:        try {]
[line 70:            return
bytesToHexString(MessageDigest.getInstance("MD5").digest(str.getBytes()));]
[line 71:        } catch (NoSuchAlgorithmException e) {]
```

CVSSv3 Base Score:

5.5 (AV:L/AC:L/PR:L/UI:N/S:U/C:H/I:N/A:N)

Reference:

JS CORS ENABLED IN WEBVIEW [SAST] [M10] [CWE-749]

MEDIUM

Description:

Cross-Origin Resource Sharing (CORS) is enabled in WebView. JavaScript used in mobile application can send and receive data from arbitrary remote hosts. This can be a risk if the remote host is impersonated or compromised.

Example of secure code:

```
WebSettings settings = getSettings();
            settings.setAllowUniversalAccessFromFileURLs(false)
            settings.setAllowFileAccessFromFileURLs(false)
```

Example of insecure code:

```
WebSettings settings = getSettings();
            settings.setAllowUniversalAccessFromFileURLs(true)
            settings.setAllowFileAccessFromFileURLs(true)
```

There is **'setAllowFileAccessFromFileURLs(true)'** found in file 'com/leanplum/messagetemplates/controllers/RichHtmlController.java':

```
[line 282:        settings.setAllowFileAccessFromFileURLs(true);]
```

There is **'setAllowUniversalAccessFromFileURLs(true)'** found in file 'com/leanplum/messagetemplates/controllers/RichHtmlController.java':

```
[line 283:        settings.setAllowUniversalAccessFromFileURLs(true);]
```

CVSSv3 Base Score:

4.8 (CVSS:3.1/AV:N/AC:H/PR:N/UI:N/S:U/C:L/I:L/A:N)

Reference:

- https://developer.android.com/reference/android/webkit/WebSettings.html

JS ENABLED IN A WEBVIEW [SAST] [M10] [CWE-749]

`MEDIUM`

Description:

The mobile application has enabled JavaScript in WebView. By default, JavaScript is disabled in WebView, if enabled it can bring various JS-related security issues, such as Cross-Site Scripting (XSS) attacks.

Example of secure code:

```
// Don't enable Javascript in WebView
```

Example of insecure code:

```
WebSettings settings = webView.getSettings();
              settings.setJavaScriptEnabled(true);
```

There is **'setJavaScriptEnabled(true)'** found in file 'com/leanplum/messagetemplates/controllers/RichHtmlController.java':

```
[line 277:          settings.setJavaScriptEnabled(true);]
```

There is **'setJavaScriptEnabled(true)'** found in file 'com/tradono/android/ui/buy/universe/BuyerUniverseView.java':

```
[line 277:
viewBuyerUniverseBinding17.trustPilotWebView.getSettings().setJavaScriptEnabled(
true);]
```

There is **'setJavaScriptEnabled(true)'** found in file 'com/tradono/android/activities/WebViewActivity.java':

```
[line 141:          webView.getSettings().setJavaScriptEnabled(true);]
```

There is **'setJavaScriptEnabled(true)'** found in file 'com/stripe/android/view/PaymentAuthWebView.java':

```
[line 81:          settings3.setJavaScriptEnabled(true);]
```

There is **'setJavaScriptEnabled(true)'** found in file
'com/clevertap/android/sdk/inapp/CTInAppBaseFullHtmlFragment.java':

```
[line 103:
this.webView.getSettings().setJavaScriptEnabled(true);]
```

CVSSv3 Base Score:

4.8 (AV:N/AC:H/PR:N/UI:N/S:U/C:L/I:L/A:N)

Reference:

- https://developer.android.com/reference/android/webkit/WebView.html
- https://developer.android.com/reference/android/webkit/WebSettings.html

HARDCODED DATA [SAST] [M2] [CWE-200]   LOW

Description:

The mobile application contains debugging or potentially sensitive hardcoded data. An attacker with an access to the mobile application can easily extract this data from the application and use it in any further attacks.

CVSSv3 Base Score:

3.3 (AV:L/AC:L/PR:L/UI:N/S:U/C:L/I:N/A:N)

INFORMATION EXPOSURE [SAST] [M10] [CWE-200]   LOW

Description:

The application contains potential information exposure of URIs that should not be present inside the application, such as a development endpoint. Often, developers include hidden backdoor functionality or other internal development security controls that are not intended to be released into a production environment. An example is a password as a comment in a hybrid app or a code segment that disables 2-factor authentication during testing. The defining characteristic of this risk is leaving functionality enabled in the app that was not intended to be released.

MISSING TAPJACKING PROTECTION [SAST] [M1] [CWE-451]   `LOW`

Description:

By default on Android 6.0 and lower, Android allows applications to overlaydraw over some portions of the phone screen and permits touch events to be sent to underlying activities. This can be used by an attacker to trick application users into performing some sensitive actions in a legitimate application (e.g. send a payment) that they do not otherwise intend doing.

Example of secure code:

```
public class MyActivity extends Activity {
                protected void onCreate(Bundle bundle) {
                    super.onCreate(bundle);

                    final Button myButton =
(Button)findViewById(R.id.button_id);
                    myButton.setFilterTouchesWhenObscured(true);

                    myButton.setOnClickListener(new View.OnClickListener() {
                        // Perform action on click
                    }
                }
            }

            <Button
                android:layout_height="wrap_content"
                android:layout_width="wrap_content"
                android:text="@string/self_destruct"
                android:onClick="selfDestruct"
                android:filterTouchesWhenObscured="true" />
```

EXPORTED ACTIVITIES [SAST] [M1] [CWE-926]   LOW

Description:

The mobile application contains exported activities that can be invoked by other applications residing on the mobile device, including malicious ones, to trigger a legitimate application activity in order to perform potentially sensitive actions.

Example of secure code:

```
<activity
                android:name=".SomeActivity"
                ....
                android:exported="false" />
```

Example of insecure code:

```
<activity

EXPORTED BROADCAST RECEIVERS [SAST] [M1] [CWE-925]   LOW

Description:

The mobile application contains an exported receiver enabling other applications, including malicious ones, to send intents without restrictions.
By default, Broadcast Receivers is exported in Android, as the result any application will be able to send an intent to the Broadcast Receiver of the application.
To define which applications can send intents to mobile application's Broadcast Receiver set relevant permissions in the Android Manifest file.

Example of secure code:

```
<permission
                android:name="com.yourpage.permission.YOUR_PERMISSION"
                android:protectionLevel="signature" />

        <uses-permission
                android:name="com.yourpage.permission.YOUR_PERMISSION" />

        <receiver
                android:name=".receivers.BatteryMonitoringReceiver"
                android:permission="com.yourpage.permission.YOUR_PERMISSION"
                ...
        </receiver>
```

Example of insecure code:

```
<receiver
                android:name=".receivers.BatteryMonitoringReceiver"
                ...
        </receiver>
```

There is **'InstallReferrerReceiver'** found in file 'android/AndroidManifest.xml':

```
[line 266:        <receiver android:exported="true"
android:name="com.tradono.android.utils.tracker.InstallReferrerReceiver">]
```

There is **'LeanplumJobStartReceiver'** found in file 'android/AndroidManifest.xml':

```
[line 376:         <receiver
android:name="com.leanplum.LeanplumJobStartReceiver"/>]
```

TEMPORARY FILE CREATION [SAST]   WARNING

Description:

The mobile application creates temporary files. Despite that cache files are usually private by default, it is recommended to make sure that temporary files are securely deleted when they are not required by the application anymore.

There is **'createTempFile()'** found in file 'com/canhub/cropper/BitmapUtils.java':

```
[line 305:                    try {]
[line 306:                        File file = File.createTempFile("cropped", str,
context.getExternalFilesDir(Environment.DIRECTORY_PICTURES));]
[line 307:                        Intrinsics.checkNotNullExpressionValue(file,
"file");]
```

```
[line 310:                        Log.e("AIC", String.valueOf(e.getMessage()));]
[line 311:                        File file2 = File.createTempFile("cropped", str,
context.getCacheDir());]
[line 312:                        Intrinsics.checkNotNullExpressionValue(file2,
"file");]
```

```
[line 315:                } else {]
[line 316:                    uriForFile =
Uri.fromFile(File.createTempFile("cropped", str, context.getCacheDir()));]
[line 317:                }]
```

There is **'createTempFile()'** found in file 'com/canhub/cropper/CropImageActivity.java':

```
[line 386:        private final Uri getTmpFileUri() {]
[line 387:            File tmpFile = File.createTempFile("tmp_image_file", ".png",
getCacheDir());]
[line 388:            tmpFile.createNewFile();]
```

There is **'createTempFile()'** found in file 'com/tradono/android/sell/selectphotos/SelectPhotosViewPresenter.java':

```
[line 100:            file.mkdirs();]
[line 101:            File createTempFile = File.createTempFile("JPEG_" + new
SimpleDateFormat("yyyyMMdd_HHmmss").format(new Date()) + "_", ".jpg", file);]
[line 102:            this.currentPhotoPath = createTempFile.getAbsolutePath();]
```

```

OBJECT DESERIALIZATION FOUND [SAST] [M7] [CWE-502]   `WARNING`

Description:

Object deserialization performed on an untrusted resource (e.g. user-supplied input or external storage), can be dangerous if the data for deserialization is tampered with by an attacker.

Example of secure code:

```
// Use only serialization when you have the control over data
```

Example of insecure code:

```
bundle.putSerializable("exampleClass", exampleOfSerializabledClass);
              exampleOfSerializabledClass =
bundle.getSerializable("exampleClass");
```

DYNAMIC LOAD OF CODE [SAST] [M7] [CWE-94]   WARNING

Description:

The mobile application uses dynamic load of executable code. Under certain circumstances, dynamic load of code can be dangerous. For example, if the code is located on an external storage (e.g. SD card), this can lead to code injection vulnerability if the external storage is world readable and/or writable and an attacker can access it.

Example of secure code:

```
// If you are using code from unsafe place (like external storage),
         // you should sign and cryptographically verify your code.
```

Example of insecure code:

```
Object test = loader.loadClass("Test", true).newInstance();
```

MISSING ANTI-EMULATION [SAST]   `WARNING`

Description:

The mobile application does not use any anti-emulation or anti-debugger techniques (e.g. detecting rooted devices or checking if contacts are authentic).
This can significantly facilitate application debugging and reverse-engineering processes.

Reference:

- https://github.com/strazzere/anti-emulator

NETWORK SECURITY CONFIGURATION IS NOT PRESENT [SAST]   `WARNING`

Description:

The mobile application does not use Network Security Configuration to define which certificates and Certificate Authorities (CA) can be used for different environments (e.g. Development, Test and Production). The Network

Security Configuration on Android feature lets application developers customize their network security settings in a safe, declarative configuration file without modifying the application code.

Reference:

- https://developer.android.com/training/articles/security-config.html

USAGE OF IMPLICIT INTENT [SAST] [M1] [CWE-927]   `WARNING`

Description:

The mobile application uses implicit intent that may be insecure under certain conditions.

Intents enable mobile applications to communicate with each other by requesting to perform different actions for which they are better suited. An implicit intent, however, does not specify to which particular application it sends a request to perform an action. If a malicious application is installed on victim's device, it may also receive the implicit intent, respond to it and perform some action instead, or in addition to, a legitimate application.

Example of secure code:

```
Intent downloadIntent = new Intent(this, DownloadService.class);
```

Example of insecure code:

```
Intent sendIntent = new Intent();
```

USAGE OF INTENT FILTER [SAST] [M1] [CWE-927]   WARNING

Description:

The mobile application uses an intent filter.
Intent filters should not be used for security purposes because they place no restrictions on explicit intents sent to the component, and can allow other applications on the same device to directly interact with them.
Intent filters are defined in the Android Manifest file, they let developers choose which type of intents their application components are supposed to receive and handle.

Example of secure code:

```
// When you use intent-filter, you have to perform input validation in your
code.
```

Example of insecure code:

```
<intent-filter>
            <action android:name="android.intent.action.VIEW" />
            <action android:name="android.intent.action.EDIT" />
            <action android:name="android.intent.action.PICK" />
            <category android:name="android.intent.category.DEFAULT" />
            <data mimeType:name="vnd.android.cursor.dir/vnd.google.note"
/>
        </intent-filter>
```

There is '<intent-filter>' found in file 'android/AndroidManifest.xml':
